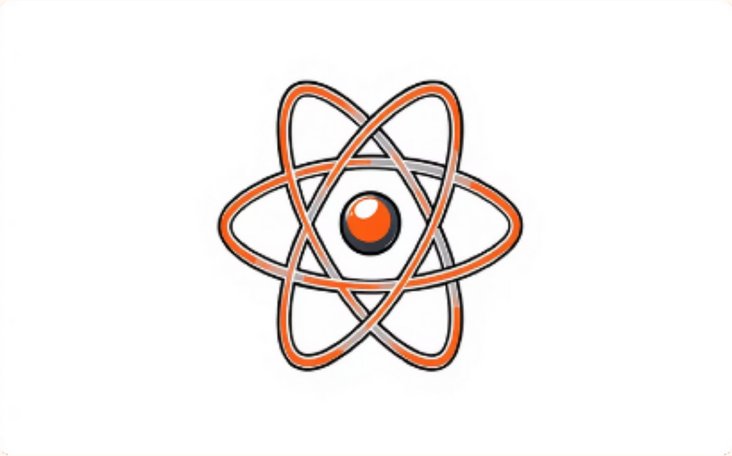
Modern Technology Stack

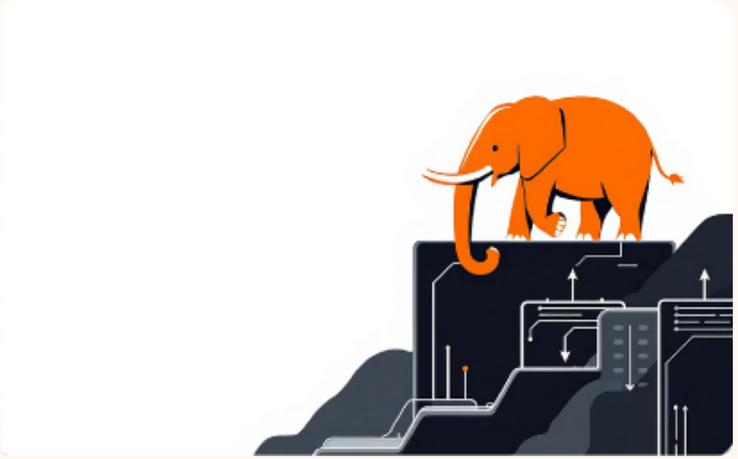
Django Backend

Robust Python framework powering secure, scalable server-side operations



ReactJS Frontend

Dynamic user interface with component-based architecture for seamless interactions



MSQL Database

Reliable relational database ensuring data integrity and efficient queries

The combination of Django REST Framework for API development and ReactJS for the frontend delivers a modern, responsive application that freelancers will love to use.

Detailed System Architecture

Frontend Layer – ReactJS

- Provides user interface for Freelancer and Admin
- Handles API requests and displays data
- Stores JWT token securely for authentication

Backend Layer – Django & Django REST Framework

- Handles business logic
- Provides RESTful APIs
- Manages authentication and authorization
- Implements role-based access (Admin / Freelancer)

Database Layer – MySQL

- Stores user, client, project, task, and invoice data
- Maintains relational integrity using foreign keys

Communication Flow:

User → React Frontend → REST API → MySQL Database → Response back to UI
